

Filtrex® Siltsoxx®

Filtrex® Sediment control is a three-dimensional tubular sediment control and storm water filtration device typically used for perimeter control, inlet protection, check dams, slope interruption, and runoff diversion for sediment and soluble pollutants on and around construction activities.

Filtrex® Sediment control traps sediment and soluble pollutants by filtering runoff water as it passes through the organic structure, and by allowing water to temporarily pond behind the device, allowing deposition of suspended solids. Sediment control is also used to reduce runoff flow velocities on sloped surfaces.

Perimeter Control

Inlet Protection

Check Dams

Concrete Washout

Slope Interruption

Runoff Diversion

Sediment Trap

Siltsoxx is available pre-filled with composted ground hardwood (FilterMedia) in pallet quantities or as "net only", fill on-site product.
